# MECCANO

## The Finest Hobby in the World for Boys

The Meccano system is composed of over two hundred and fifty different parts, mostly made of steel or brass, each one of which has a definite mechanical purpose. These parts combine to form a complete miniature engineering system with which practically any mechanical movement may be reproduced in model form. More can be accomplished with Meccano than with any other constructional toy, for no other system has such possibilities. The genius is in the parts and you can commence to build models as soon as you get your Outfit home. A screwdriver, provided in the Outfit, is the only tool necessary.

There is no limit to the number of models that can be built with Meccano—Cranes, Clocks, Motor Cars, Ship-Coalers, Machine Tools, Locomotives—in fact everything that interests boys. The most wonderful feature about the system is that it is *real engineering* in miniature; it is fascinating and delightful and it gives you a satisfaction beyond anything that you have ever previously experienced.

## The "Meccano Magazine"

The *Meccano Magazine* is the Meccano boy's own newspaper. It tells him of the latest Meccano models; what Meccano Clubs are doing; how to correspond with other Meccano boys; the Competitions that are running, etc. It contains splendid articles on such subjects as Railways, Famous Engineers and Inventors, Electricity, Bridges, Cranes, Wonderful Machinery, Aeronautics, Latest Patents, Radio, Stamps, Photography, Books and other topics of interest to boys, including suggestions from Meccano boys for new Meccano parts and correspondence columns in which the Editor replies to his readers' enquiries. The publishing date is the first of each month. If you are not already a reader of the *Meccano Magazine* write to the Editor for full particulars, or order a copy from your Meccano dealer or from any newsagent.

## Model-Building with Meccano

Make the simple models first—they will provide hours of fun—and then try to improve them. Every model can be made in a dozen different ways. It is important to screw up all the nuts and bolts tightly to ensure that your models will be strong and firm when they are completed.

Every keen and inventive Meccano model-builder should obtain copies of the special Manuals "How to use Meccano Parts" and "Meccano Standard Mechanisms." In the former the principal uses of Meccano parts are outlined, while the latter shows a large number of real engineering mechanisms, built of Meccano parts, that can be incorporated in various models. You can obtain copies of these Manuals from your dealer, or direct from Meccano Ltd., Old Swan, Liverpool.

## How to Build up Your Outfit

Meccano is sold in ten different Outfits, numbered 000 to 7. All Meccano parts are of the same high quality and finish, but the larger Outfits contain a greater quantity and variety of parts, making possible the construction of more elaborate models. Each Outfit from No. 00 upwards may be converted into the one next higher by the purchase of an Accessory Outfit. Thus, a No. 00 may be converted into a No. 0 by adding to it a No. 00A. A No. 0A would then convert it into a No. 1, and so on. In this way, no matter with which Outfit you commence, you may build it up by degrees until you possess a No. 7 Outfit. It is important to remember that Meccano Parts may be bought separately at any time in any quantity from your Meccano dealer.

The  $2\frac{1}{2}'' \times \frac{1}{4}''$  Double Angle Strips 1 are attached to the  $5\frac{1}{2}'' \times 2\frac{1}{4}''$  Flanged Plate 2 by lock-nutted bolts as in Standard Mechanism No. 263. The Bolts 3 are secured to the  $5\frac{1}{2}''$  Strip 4 and their shanks engage with the centre holes in the  $2\frac{1}{2}'' \times \frac{1}{4}''$  Double Angle Strips 1, thus maintaining the legs 5 in an upright position. When it is desired to fold up the legs 5, it is only necessary to raise the ends of the Strip 4, thus freeing the Double Angle Strips 1. The table is shown in the folded position in Fig. 00.39A.

### HOW TO CONTINUE

This completes our examples of models that may be made with MECCANO Outfit No. 0 (or No. 00 and No. 00A). The next models are a little more advanced, requiring extra parts to construct them. The necessary parts are all contained in a No. 0A Accessory Outfit, the price of which may be obtained from any Meccano dealer.

These Models can be built with MECCANO Outfit No. 1 (or No. 0 and No. 0A)

35

### Model No. 1.1 Jockey Pulley

Parts required :

1 of No. 3	2 of No. 35	1 of No. 52
4 " " 5	20 " " 37	1 " " 54
2 " " 17	1 " " 37A	2 " " 111c
4 " " 22	1 " " 40	2 " " 126
	1 " " 48A	

The weight of the pivoted  $3\frac{1}{2}$ " Strip, augmented by the 1" fast Pulley Wheel, causes the jockey pulley to press on the belt. Hence the latter is kept always taut.

The suspended weights represent three forces acting on a central point. If a triangle is drawn with its sides respectively parallel to the three converging cords, i.e., parallel to the directions of the three forces, the lengths of the sides will be found to be proportional to the respective magnitudes of the forces.

The Strip 9 represents the saw. The Crank Handle drives, through a belt 1, a short Rod journalled in a Double Bracket 2 and carrying a Bush Wheel 3. The latter imparts a reciprocating motion to the saw frame 4 through a 2 1/2" Strip 5 loosely mounted on Bolts secured to the Bush Wheel and to an Angle Bracket bolted to the saw frame. This frame slides on a 3 1/2" Rod 6, which acts as a guide, passing through the frame and supported in a Reversed Angle Bracket 7. A Washer is placed on the Bolt 8 behind the Bracket 7. A vice to secure the objects in position for cutting consists of a Flat Bracket 10 mounted on a Bolt 11, a few turns of which causes the Flat Bracket to grip the object 12. The Bolt 11 enters a Nut held between the Flat Trunnion 13 and 5 1/2" Strip 14, which are spaced apart for the purpose by Washers placed on the two Bolts holding the Trunnion in position. The saw frame rests on the stop 15 when not in use. A 1" Pulley secured to the top of the frame acts as a weight and helps to steady the saw.

The  $5\frac{1}{2}$ " Strip is pivoted to the  $2\frac{1}{2}$ " Strip by means of a Bolt and two Nuts, and the  $2\frac{1}{2}$ " Strip is similarly pivoted to the Sector Plate. By revolving the  $2\frac{1}{2}$ " Strip about its pivot, the vertical  $1\frac{1}{2}$ " Rod can be made to trace a locus. If the positions of the  $1\frac{1}{2}$ " Rod and the  $5\frac{1}{2}$ " Strip are altered, several different loci may be traced. Machines of this type are of advantage in assisting in the design of engine connecting rods.

These Models can be built with MECCANO Outfit No. 1 (or No. 0 and No. 0A)

### Model No. 1.86 Double-Action Pump

The  $5\frac{1}{2}$ " Strip 1 is attached to the 1" Pulley Wheel 2 by means of two Angle Brackets, through the lower of which passes the Set-Screw that secures the Pulley to its 2" Rod. Two Washers are placed beneath the head of the Bolt joining the Angle Brackets in order to prevent its shank from binding on the boss of the Pulley 2. The joints 3, 4, 5, 6, 7, are all lock-nutted, the remainder of the joints being quite rigid. When the Strip 1 descends, together with the first pump, the incidental distortion of the parallelogram 3, 4, 7, 4 causes the second pump to rise. Similarly, when the first pump rises, the second descends.

### Model No. 1.90 Gong

Begin to build this model by making the platform from a Flanged Plate and 12½" Strips. The drive from the Pulley on the Crank Handle is taken to a 1" Pulley, fast on the vertical 2" Rod, another similar Pulley being secured to this Rod beneath the Plate.

The arms are formed of four 5½" Strips bolted to a Bush Wheel fast on the 2" Rod.

### Model No. 1.96 Ballista

This is a model of an ancient engine of war, resembling the crossbow. The  $3\frac{1}{2}$ " Strip 1 is bolted firmly to the Double Angle Strip 2, which is prevented from turning by the addition of Angle Brackets as shown. A Double Bracket 3 slides on the Strip 1 and is secured to a piece of cord. On rotation of the Crank Handle 4, the Strip 1 is pulled backward until the Double Bracket 3 slips off its end. The Strip then flies forward and strikes the missile, which consists of a 2" Rod placed ready in the Double Bracket 5.

The trolley is operated by means of a cord that is wound round the  $1\frac{1}{2}$ " Axle Rod carrying the Bush Wheel, both ends of the cord being secured to the trolley. The bucket is suspended from a cord that winds on to the Crank Handle, and it is tipped by lowering it until a short cord that is attached to the bottom of the bucket and to the trolley, becomes taut. Further lowering causes the bucket to swing over.

## Model No. 1.112 Beam Engine

The connecting Strip 1 is attached pivotally by a Bolt and two Nuts (Standard Mechanism No. 262) to one end of the beam 2 and to the Bush Wheel 3. The Strip 4 is similarly connected to the other end of the beam 2 and to the Double Bracket 5 attached to the piston rod. The short rod carrying the flywheel 6 is journaled in a  $2\frac{1}{2}$ " Strip supported by the Trunnion 7 and in a Reversed Angle Bracket bolted to the  $2\frac{1}{2}$ " Strip.

A short length of elastic is doubled and stretched between the centres of the 3" Pulley Wheels. A weight, consisting of two 1" fast Pulley Wheels and a 1½" Rod, is suspended from it in the middle of the drum. When the Cum Bak is rolled along any smooth level surface, the elastic becomes twisted and stores up sufficient energy to return the drum to its starting point. If the mechanism is concealed by a thin cardboard covering, the model will cause much amusement by its mystifying behaviour.

### Model No. 1.122 The Invalid

When wheeled along the table the "invalid" appears to push himself energetically along. His neck is a Flat Bracket: his right (or propelling) arm consists of one Angle Bracket and one  $\frac{1}{2}$ " Reversed Angle Bracket, and his left arm—the hand of which is bolted loosely to the chair—is formed by three Angle Brackets. The chair is composed principally of two Sector Plates and four  $5\frac{1}{2}$ " Strips, and it runs on three 1" Pulley Wheels—one in front and two at the back. One of these (not visible in the illustration) drives by cord another 1" Pulley Wheel, the shaft of which also carries a Bush Wheel 1. As will be seen, a  $2\frac{1}{2}$ " Strip is pivoted at one end to this Bush Wheel and at the other end to a second  $2\frac{1}{2}$ " Strip 2, which, rocking about an axle journaled through its centre hole, is again pivoted to the invalid's hands.

These Models can be built with MECCANO Outfit No. 1 (or No. 0 and No. 0A)

### Model No. 1.124 Rotating Crane

The running wheels of this crane are journaled in Double Angle Strips bolted to the base plate and secured at an angle by means of Flat Brackets. The rear of the Base Plate is supported on a Double Bracket. The jib is bolted loosely to the supporting  $5\frac{1}{2}$ " Strips and is connected by  $2\frac{1}{2}$ " Strips to the Sector Plate which pivots about its supporting bolts. By moving this Sector Plate the elevation of the jib may be altered as desired. The movement is controlled by a Double Angle Strip mounted on the Crank Handle and connected pivotally to the plate by means of a  $2\frac{1}{2}$ " Strip. A Reversed Angle Bracket bolted to an upright Double Angle Strip in the rear of the model serves to restrict the movement of the Sector Plate.

### Model No. 1.134 Travelling Crane

The jib 1 is pivoted to the Flat Trunnions 2, which are bolted to 3 to Angle Brackets secured to a Bush Wheel. The latter is nipped to a 2" Rod 4 passing through the Plate 5 and further supported in a Double Angle Strip 6. A Washer and Spring Clip mounted on the Rod 4 below the Strip 6 secure the crane to the carriage. The jib is supported by means of cords 7 tied to 2½" Strips 8, the holes of which engage the shank of a bolt passed through the Sector Plate 9, and its elevation may be altered by inserting this bolt in different holes in the Strips 8. The cord 10 of the brake lever is wound once round the Crank Handle, between two Washers.

The upper end of the Strip 1 is connected pivotally by a Bolt and two Nuts to the crosshead bracket 2. The crankshaft is built up as follows: Two Angle Brackets 3 are each secured rigidly to the boss of a Pulley Wheel and are connected to each other by a  $\frac{3}{8}$ " Bolt carrying three Nuts. The Nuts are screwed tightly against the Brackets, sufficient space being left between the inner pair to enable the connecting Strip 1 to turn freely. The valve Rod 5 is operated by the Flat Bracket 4 that is clamped between two further 1" Pulleys on the crankshaft in such a way that its protruding end serves as a cam.

These Models can be built with MECCANO Outfit No. 1 (or No. 0 and No. 0A)

### Model No. 1.153 Pile Driver

The winding cord is passed round the Pulley at the top of the model and is fastened to an Angle Bracket that is hooked under the protruding portion of a Flat Bracket bolted to the top of the driving head. When the Angle Bracket reaches the Pulley at the top it is pushed out a little, thus releasing the driving head.

The treadle lever is connected pivotally to a  $3\frac{1}{2}$ " Strip by a Bolt and two Nuts. The upper end of this Strip is similarly connected to a  $2\frac{1}{2}$ " Strip that is clamped tightly between two Pulleys on the hammer Rod. Pressure on the treadle causes the hammer to descend on the work. When the treadle is released a weight pulls the hammer back to its original position.

This is an apparatus for determining the forces that act at the crosshead of a reciprocating engine. The upper inclined length of cord represents the connecting rod and the lower, or vertical portion, the piston rod. The pull on the third cord indicates the pressure exerted on the slide bars of the engine due to the angularity of the connecting rod.

The Double Angle Strip 1 carries the front road wheels and is bolted pivotally to the 5½" Strip 2, whilst the rear axle is journaled in two Angle Brackets rigidly secured to the Strip 2. A Cranked Bent Strip 3 represents a seat. The steering wheel consists of a ½" Pulley 4 bolted to an Angle Bracket.

### Model No. 1.176 Motor Car

The steering column 1 is journaled in an Angle Bracket 2 bolted to the 5½" x 2½" Flanged Plate 3, and in the second hole of the 2½" x ½" Double Angle Strip 4. A Bush Wheel 5, secured to the lower end of the steering column, is connected by two short lengths of cord to a second 2½" x ½" Double Angle Strip carrying the front axle. The Strip is pivoted to a similar Double Angle Strip 6 by means of a Bolt and Nuts (Standard Mechanism No. 262).

This model will provide many hours of enjoyment. The cords may be made to any length to allow the load to be carried from one side of the room to the other, and, if necessary, a better grip may be obtained by winding the operating cord twice round the Pulley on the Crank Handle. The open sides of the bucket may be closed with cardboard so that it may be loaded with marbles, beads, etc. The bed of the telpher may be screwed on to a solid base with ordinary wood screws to give better support. The pulley bracket, and that securing the cord on which the bucket travels should be screwed in a suitable position on the opposite side of the room.

The "bait" consists of a 1" fast Pulley and a  $\frac{1}{2}$ " loose Pulley suspended by means of a cord from a Double Bracket. The latter is bolted to a  $1\frac{1}{2}$ " x  $\frac{1}{2}$ " Double Angle Strip that is free to turn on a 2" Rod journaled in a pair of Angle Brackets. A Flat Bracket bolted to the Double Bracket engages a second Double Bracket on the end of a  $5\frac{1}{2}$ " Strip that is bolted to the door of the cage. If the "bait" is touched, the heavily-weighted door falls into place, and is prevented from re-opening by catches formed from Flat Brackets secured to  $5\frac{1}{2}$ " Strips that are bolted to the trap by their extreme ends and act as springs.

Most boys have heard of the Pantograph but not many have had an opportunity of seeing its principles demonstrated. It is an instrument for copying plans, etc., on the same or on a reduced or enlarged scale.

The apparatus is fixed at the point A. If an enlarged sketch is to be made, the point B is traced round the outlines, the writing point C reproducing the sketch on a larger scale. When a reduced drawing is to be made, the point C traces the outline, whilst the point B reproduces the sketch on a smaller scale. The degree of enlargement or reduction varies according to the position in which point C is fixed on the perforated arm.

The bolts at D are fitted with lock-nuts to allow free movement of the  $12\frac{1}{2}$ " Strips.

### Model No. 1.192 A Sudden Appearance

The Sector Plate 1, forming the lid, is carried pivotally on an axle rod that passes through its sides three holes from the end, and the rear Sector Plate 2 is pivoted in a similar manner, excepting that the rod in this case passes through the fourth hole from the end. Pieces of thin elastic are tied to the end holes in each side of the front Sector Plate at its widest end, and are connected to a Rod journalled in the sides of the box. The "Meccanite" 3 is placed face downward inside the box with his feet towards the far end of the model. The tension of the elastic holding the lid 1 should be sufficient to keep him in this position. On tilting the Plate 1 slightly, however, he will suddenly shoot out of the box, drawn by the elastic bands 4 connected to the  $3\frac{1}{2}$ " Axle Rod 5.

## Model No. 1.201 Automatic Drill

Cord is passed round the Pulley on the drill spindle 4 and thence over the Pulleys 3 and round the shaft of the Pulley 1. The lever 2 (a  $3\frac{1}{2}$ " Strip) is pivoted by a Bolt and two Nuts at its inner end to an Angle Bracket, and the latter is bolted to a  $1\frac{1}{2}$ "  $\times$   $\frac{1}{2}$ " Double Angle Strip which, in turn, is bolted between the vertical  $2\frac{1}{2}$ " Double Angle Strips. The arm of the lever engages between two Washers on the drill spindle, and on pressing the lever, the drill spindle with its 1" Pulley is forced downwards, thus tightening the Cord, which then transmits the drive to the drill spindle. Immediately pressure on the lever is released, the drill comes to rest.

The weighted Curved Strip normally holds the end of the  $5\frac{1}{2}$ " Strip against an Angle Bracket, allowing the signal arm to fall to the "all clear" position. Any train passing the signal however, strikes the opposite end of the  $5\frac{1}{2}$ " Strip, and by means of the cord shown, raises the arm to indicate "danger." The Curved Strip moves to allow the end of the  $5\frac{1}{2}$ " Strip to pass over it, and is returned to its original position by reason of its weighted end. The signal then remains at "danger" until the mechanism is re-set.

**Model No. 1.205 Patent Luffing Crane**

The hoisting cord 1 is operated by the Crank Handle 2. It passes over the 1" Pulley 3, round the 1" Pulley 4 at the jib head, back and round a third 1" Pulley 5, and then over the  $\frac{1}{2}$ " loose Pulley 6 at the jib head and down to the hook. With this arrangement it will be found that the load remains at a constant height when the jib is luffed. The luffing cords 7 are attached to the jib head, passed over the 2" Rod carrying the Pulleys 3 and 5, and wound on to the luffing winch 8.

The warp threads are tied at one end to a Double Angle Strip 1, whilst their other ends are secured alternately to the tops of the upright Strips 2, and the  $2\frac{1}{2}$ " Strip 3. The "shedding" movement of the warp is obtained by moving the Strip 3 up or down each time the shuttle—a  $3\frac{1}{2}$ " Rod 4—is passed between the two layers of warp 5 and 6. Wool or similar material is particularly suited to this apparatus. The strands 6 should be kept very taut, and the weft threads may be closed up with the woven portion by means of an ordinary comb each time the shuttle passes.

These Models can be built with MECCANO Outfit No. 1 (or No. 0 and No. 0A)

### Model No. 1.212 Disappearing Meccanition

The bottom of the box-like portion of the model consists of a  $5\frac{1}{2}'' \times 2\frac{1}{2}''$  Flanged Plate; three  $5\frac{1}{2}''$  Strips bolted to upright  $2\frac{1}{2}''$  Strips form each side and each end consists of three  $2\frac{1}{2}'' \times \frac{1}{2}''$  Double Angle Strips. The lid 1, which is mounted pivotally on an Axle Rod 2, consists of two Sector Plates bolted together. Elastic bands are tied to the sides of these Plates and connected to Rod 3 passed through the bottom of the box. The "Meccanition" 4 also is connected to this Rod by pieces of elastic. On pressing the end of the rear Sector Plate the lid opens sufficiently to allow the figure to be drawn inside and then snaps back into place. A Cranked Bent Strip 5 is bolted at the back of the figure and rests against the edge of the Sector Plate.

The Sector Plates 1 and 2 are mounted pivotally on the Rods 3. Two large buttons, 4 are placed on lengths of thread or thin elastic stretched between the arms of the Meccanitions 5. Start the model as follows: twist the threads a little with your fingers, pull the Meccanitions outward, then release them sharply. As soon as the buttons are spinning a slight downward touch on the feet of each Meccanition is sufficient to keep them going. The ends of the Sector Plates 1 and 2 are connected to the Flanged Plate 6 by means of pieces of elastic 7.

The 3" Pulley Wheel is bolted to the 5½" x 2½" Flanged Plate as shown, and the Rod 6 is free to rotate in its boss. The Bolts 1, 2, 3, are provided with lock-nuts. When the engine to which the governor is attached works at too great a speed, the 1" fast Pulley Wheels 4 fly outward and lift the two Double Brackets 5. In actual practice this movement is utilised to close the engine valves and so reduce speed.

The base of the swivelling portion of the crane consists of a 3" Pulley Wheel 1, which has a 3½" Axle Rod nipped in its boss. The Rod is journaled in two 2½" Double Angle Strips 2 and 3 secured between the Sector Plates 4. The brake cord 5 passes round the 3" Pulley as shown, and is tied to one of the holes in the Bush Wheel 6. The cords 7 serve merely to support the weight of the jib.

## HOW TO CONTINUE

This completes our examples of models that may be made with MECCANO Outfit No. 1 (or No. 0 and No. 0A). The next models are a little more advanced, requiring a number of extra parts to construct them. The necessary parts are all contained in a No. 1A Accessory Outfit, the price of which may be obtained from any Meccano dealer.

These Models can be built with MECCANO Outfit No. 2 (or No. 1 and No. 1A)

### Model No. 2.17 Roundabout

When the Crank Handle is turned, the drum 2 (formed by butting together two  $\frac{1}{2}$ " Flanged Wheels) turns the 3" Pulley Wheel 3 by means of an endless cord. The 1" fast Pulley Wheel 4 similarly turns a second 3" Pulley Wheel 5 resting on another 3" Pulley Wheel 6 (see Fig. 2.17A). The end of the Axle Rod 7 is quite free to revolve in the boss of the lower 3" Pulley Wheel 6.

Each engine is represented by a  $\frac{1}{2}$ " Flanged Wheel 1 and a  $\frac{1}{2}$ " fast Pulley Wheel secured to a 2" Rod journalled in a Double Bracket 2, which is bolted to the  $2\frac{1}{2}$ "  $\times$   $\frac{1}{2}$ " vertical Double Angle Strip 3. The  $12\frac{1}{2}$ " Strips 4 of the fuselage proper are bolted to the two Sector Plates 5, and also by means of Angle Brackets to the wings. The tail plane consists of two  $5\frac{1}{2}$ " Strips to which a similar Strip, representing the movable portion of the plane, is attached by means of Flat Brackets.

### Model No. 2.31 Motor Lorry

The driving spindle of the Clockwork Motor is removed and in its place is inserted a  $3\frac{1}{2}$ " Rod forming the rear axle, the special Pinion inside the Motor being secured to this Rod, of course, instead of to the driving spindle. The steering is operated by a Bush Wheel on a vertical  $3\frac{1}{2}$ " Rod journalled in a Double Bent Strip. Cord is wound round the lower part of this Rod and its ends are secured one to each end of a Double Angle Strip carrying the front axle. A Crank is bolted to this Double Angle Strip and carries a short Rod that is journalled in the boss of a further Crank bolted to the Flanged Plate.

### Model No. 2.32 Try-Your-Strength Machine

The Bush Wheel 1 is secured to a short Axle Rod 2, the lower end of which rests on a pair of Angle Brackets 3 bolted to the ends of four  $5\frac{1}{2}$ " Strips 4. The Strips 4 are pivoted as shown (Fig. 2.32A) on a  $1\frac{1}{2}$ " Rod 5, and on their opposite ends rests a  $\frac{1}{2}$ " loose Pulley Wheel 6. When the Bush Wheel 1 is struck, the  $5\frac{1}{2}$ " Strips fling the Pulley Wheel 6 upward, but the wheel is guided by the vertical  $12\frac{1}{2}$ " Strips 7. The weight of the Strips 4 then causes the Bush Wheel to resume its original position.

### Model No. 2.38 Travelling Jib Crane (Electrically Operated)

The swivelling structure is bolted to the 3" Pulley Wheel 1, which rests on a second 3" Pulley bolted to the travelling base. A short Rod secured to the boss of the upper Pulley is free to rotate in the boss of the lower one. The Electric Motor 2 controls the hoisting gear and the arrangement of the drive will be clear from the photograph. The jib is luffed on operation of the Crank Handle 3, the cord of which passes round the Axle Rod 4 in the jib, then round the Rod 5 in the base, back round the Rod 4 and is finally secured to a Flat Bracket on the Rod 5.

### Model No. 2.39 Travelling Jib Crane (Hand Operated)

This shows a section of Model No. 2.38 fitted for hand operation, thus dispensing with the necessity of the Electric Motor. In this case the hoisting cord is operated by the hand wheel 6, the Rod of which is controlled by a hand brake 7. The end hole of the lever of the latter is pivotally mounted on the Rod 8. The luffing movement of the jib is effected by the Crank Handle 9. The operating cord passes round the Rod 10 attached to the jib, then round Rod 11 in the base of the model, again round Rod 10, back round Rod 11, and once more round Rod 10. The end of the cord is then tied to a Flat Bracket on the Rod 11.

### Model No. 2.42 Carrier Tricycle

Each pedal of the tricycle consists of an Angle Bracket pivotally attached to a Crank 1 by means of a Bolt and two Nuts (see S.M. No. 262). The Cranks are secured to a  $1\frac{1}{2}$ " Axle Rod carrying a 1" fast Pulley Wheel 2. A cord passes round this Pulley and around the 3" Pulley Wheel 3, which is spaced away from the  $2\frac{1}{2}$ " Strips 4 by a 1" fast Pulley Wheel 5. The Double Bracket 6 (Fig. 2.42A) is attached pivotally to the lower framework by a Bolt and Lock-Nuts (S.M. 263).

The ladder is elevated on operation of the Crank Handle 1, which winds in a cord tied to the Double Angle Strip 2. Angle Brackets bolted to the 12½" Angle Girders 12 are attached pivotally to the 5½" Strips 13 by means of Bolts and Nuts (S.M. 262), and the action of winding in the cord thus causes the ladder to swing upward. It is prevented from falling by the friction of the 1" Pulley Wheels 10 (Fig. 2.44A), which press against the two Sector Plates. When the ladder is fully elevated, its lower ends act as brakes to prevent the road wheels from revolving.

A second cord is wound upon the Rod 3. One end is then carried over the ½" loose Pulley Wheel 4 and tied to the 2½" Strip 5, the opposite end being carried directly to the same Wheel and secured to it. When the handle 8 is turned, the two ends of the cord are wound and unwound simultaneously, and the ladder is extended or shortened as required. A permanent brake is provided by a cord passing over the 1" Pulley Wheel 7 and having both its ends secured to the 2½" Strip 8. The Strip 8 is bolted firmly to the Angle Bracket 9 (Fig. 2.44A) and keeps the brake continuously in action.

FIG. 2.44A

## Model No. 2.45 Electric Truck

An underneath view of the truck is shown in Fig. 2.45A. The front axle is journalled in a 1½" x ½" Double Angle Strip 1 that is free to turn on a Double Bent Strip 2, from which it is spaced by a ½" loose Pulley. A length of cord is wrapped round the 1" Pulley 3, which is secured to the end of the steering column, and then passed through a Cranked Bent Strip 4 and secured to the Double Angle Strip 1 as shown. The brake cord 5 is attached to the Double Bent Strip 2, wrapped several times round the ½" Flanged Wheels 6, passed through the Angle Bracket 7, and is finally attached to the Crank 8. The operating pedal consists of Double Brackets bolted to another Crank that is secured to the same Rod as the Crank 8.

This is an alternative construction of the base of Model No. 2.46, and shows how the Electric Motor may be dispensed with if necessary. Two 3" Pulley Wheels 1 are bolted together by four Double Brackets to form a drum on which the hoisting cord is wound. The cage is raised or lowered on operation of the handle 2, which is connected to the winding drum by an ordinary belt drive. The cage is prevented from overhauling by a hand brake that acts on the groove of a third 3" Pulley Wheel 3. The brake normally is applied by the weight of the  $\frac{1}{2}$ " loose Pulley Wheel 4, which is secured to the end of a 5 $\frac{1}{2}$ " Strip that is bolted to the crank 5.

### Model No. 2.48 Steam Lorry

The boiler of the engine is built up of 2 $\frac{1}{2}$ " x  $\frac{1}{2}$ " Double Angle Strips bolted to the Bush Wheel 1, and to two 2 $\frac{1}{2}$ " Strips 2, which are joined together by Flat Brackets 3. A 2 $\frac{1}{2}$ " Curved Strip (small radius) is bolted to the upper Strip 2. A cord is passed completely round two  $\frac{3}{4}$ " Flanged Wheels 4 secured to the steering column, and its ends are tied to the 2 $\frac{1}{2}$ " x  $\frac{1}{2}$ " Double Angle Strip 5. The Double Bent Strip bolted to the Strip 5 is pivoted by a bolt and two nuts to the Sector Plate.

The Axle Rod 1 is journaled in a  $2\frac{1}{2}'' \times \frac{1}{2}''$  Double Angle Strip 2. The latter is bolted to a Double Bent Strip that is pivoted to the Flanged Plate 3 by a Bolt and two Nuts. Steering is effected by a cord attached to the ends of the Double Angle Strip 2 and passed round a  $1''$  Pulley Wheel fastened to the lower end of the steering Rod.

The  $3''$  Pulley Wheel 2, which supports the jib, is free to turn on a short Axle Rod secured in the boss of the lower  $3''$  Pulley Wheel 2a. The vertical  $12\frac{1}{2}''$  Strips 13 are bolted at their tops to a Double Bracket, to the centre hole of which is secured a Bolt 14 that is free to turn in the Flat Trunnion 15.

The swivelling movement of the crane is carried out by turning the handle 1, which simultaneously winds and unwinds the ends of a cord passing round the  $3''$  Pulley Wheel 2 (see Fig. 2.52A). The cord 12, which is tied to the Flat Bracket 3 at the head of the jib passes over the  $2''$  Rod 4, under a similar Rod 5, and between two vertical  $2''$  Rods 6, which act as guides, and is finally wound on to the Crank Handle 7. Hence on operation of the latter the jib is raised or lowered. The cord 8 also passes round the Rods 4, 5 and 6, and is wound on to the Rod 9. Operation of the handle 10 raises and lowers the hook. The cords 8 and 12 are prevented from unwinding by band-and-pulley brakes 16.

The handle 1 carries a 1" Pulley 2, which drives by means of a cord a similar Pulley on a 2" Rod 3 journaled in a Cranked Bent Strip bolted to the Sector Plate. Two Double Brackets 4 are secured together by a Bolt 5, the shank of which presses very tightly on the Rod 3. This locks the Double Brackets in position, and they revolve with the Rod 3. The outer Double Bracket carries a 1½" Rod 6, the end of which lies between two Strips 7, arranged at a short distance apart from each other and bolted to two Flat Brackets. These are secured to a further Strip 8 bolted pivotally to a transverse Double Angle Strip. As the shaft 3 rotates, the Rod 6 slides between the Strips 7 and so rocks the Strip 8 from side to side to represent the shuttle.

The Bush Wheel 9 carries two Angle Brackets placed together in the form of a Double Bracket, with their elongated holes overlapping, and in such a position that an imaginary line drawn through their opposite round holes, would cross the centre of the Bush Wheel. A Flat Bracket is bolted to the inner Angle Bracket in a line with the Crank Handle and forms a lever which engages 1" Pulley 10 mounted on a vertical sliding Rod 11. This Rod is journaled in a Double Angle Strip bolted between the lower holes of the two Flat Trunnions and is further supported by two ½" Reversed Angle Brackets secured to the Angle Strip. As the Bush Wheel rotates, the Flat Bracket imparts to the Rod 11 a movement corresponding to the action of the needle.

The outer Angle Bracket on the Bush Wheel strikes once in every revolution the end of a Double Angle Strip 12. This is pivotally mounted by a Bolt passed through its second hole from the Bush Wheel end to the centre hole of the Flat Trunnion on that side of the model. The resulting movement of the Strip 12 represents the apparatus that pays out the cotton from the reel.

The general construction of the model will be made clear by reference to Figures 2.54A and 2.54B. Rotation of the handle 1 causes the gun to revolve on the 3" Pulley Wheel 2. The barrel of the gun is so balanced on the Axle Rod 3 that it tends to fall by its own weight, but is prevented from doing so by a cord 4 tied to the gun close to the breech and wound on the 3½" Rod 5. By turning the Pulley Wheels 6 the muzzle is raised or allowed to fall.

### HOW TO CONTINUE

This completes our examples of models that may be made with MECCANO Outfit No. 2 (or No. 1 and No. 1A). The next models are a little more advanced, requiring a number of extra parts to construct them. The necessary parts are all contained in a No. 2A Accessory Outfit, the price of which may be obtained from any Meccano dealer.

These Models can be built with MECCANO Outfit No. 3 (or No. 2 and No. 2A)

### Model No. 3.2 Strip-Bending Machine

This model represents a device for bending bars or rods of metal to circular form, and may be put to practical purpose in shaping strips of tin or similar material. A loose Pulley 1 is spaced by a Collar and Washers in the centre of the short Rod 2 journaled in a  $1\frac{1}{2}$ " Strip 3. The latter is secured to the end of a  $\frac{3}{4}$ " Bolt 4 and spaced away from the 3" Pulley 5 by means of a number of Washers. The opposite end of the Rod is supported by a  $5\frac{1}{2}$ " Strip 6. The handle 7 is secured to a  $3\frac{1}{2}$ " Rod carrying a  $\frac{1}{2}$ " Pinion 8. This engages with a 57-teeth Gear Wheel 9 mounted on another  $3\frac{1}{2}$ " Rod which is free to revolve in the boss of the wheel 5. The Gear Wheel 9 carries a 3" Strip 10 forming one of the bearings for a short Rod carrying a second 1" loose Pulley 11. The latter is also spaced by means of a Collar and Washers so that it lies immediately above the groove of the Pulley Wheel 5. The material to be shaped is passed between the two loose Pulleys at the top of the wheel 5, and on rotation of the handle 7 the arm 10 is caused to move downward, so forcing the object to the same curvature as the circumference of the wheel.

### Model No. 3.5 Lawn Mower

The grass box 1 is retained in position by two Flat Brackets bolted to the  $2\frac{1}{2}" \times \frac{1}{2}"$  Double Angle Strip 2 but spaced from it by a Washer on each Bolt. The edge of the Double Angle Strip 3 may be slipped in the space between the Double Angle Strip 2 and the Flat Brackets, one of which is shown at 4.

### Model No. 3.10 Actuated See-Saw

The model is actuated by the motion of one pair of travelling wheels. The axle to which these wheels are secured carries two 1" fast Pulley Wheels, which are connected by endless cords to similar Pulleys on the same Rod as a  $\frac{1}{2}$ " Pinion Wheel. This  $\frac{1}{2}$ " Pinion meshes with a 57-teeth Gear Wheel secured to the Rod of a Bush Wheel, and the latter is connected by means of a  $3\frac{1}{2}$ " Strip to an extended crank (a  $2\frac{1}{2}$ " Strip and a Crank bolted together) secured to the pivotal Rod of the see-saw.

### Model No. 3.13 Drop the Nigger

The hand levers 1 are each pivotally attached to the car by a Bolt and two Nuts (see Standard Mechanism No. 262) and are connected in a similar manner to two further levers, one of which, seen at 3, is pivoted to a Bush Wheel 4 while the other, on the further side of the model, is pivoted to a Coupling, which serves as a crank in the same way as the Bush Wheel 4. Both Bush Wheel and Coupling are secured to the Rod carrying the Gear Wheel 5, and motion is thus transmitted to the rear wheels. The steering foot lever 6 is secured by a Crank to a short vertical Rod which, in turn, is secured by another Crank to the Double Angle Strip carrying the front axle.

The Sector Plate 1 is a target, which, when hit, allows the nigger to be dropped. The Plate 1 is carried on the Strip 2 pivoted at 3, and the weight of the nigger supported on another Sector Plate 4 pivoted at 5 by means of the cord 6 keeps the lower end of the Strip 2 hard against a short Rod 7 pivoted at 8. When the target is hit and knocked back the Rod 7 is released and falls about its pivot, allowing the Sector Plate 4 with the nigger to drop.

The arrangement of the treadle is shown in detail in Fig. 3.19A. The Crank 1 is provided with a Flat Bracket, the round hole of which coincides with the elongated hole of the Crank, and receives the short Rod 2. The Crank 1 is free to turn about a Threaded Pin 3, secured to the 3" Pulley Wheel 4, and once the latter is set in motion it can be kept in rotation by working the treadle 5. The Strips 6 of the saddle (Fig. 3.19) are duplicated and their ends form slots to receive the flanges of the Angle Girders 7. The hand wheel 8 is a dummy one, but if desired it may be arranged to operate the saddle by an endless rope device.

FIG. 3.19A

These Models can be built with MECCANO Outfit No. 3 (or No. 2 and No. 2A)

### Model No. 3.20 Tank Wagon

### Model No. 3.21 Flax Cleaner

The six  $3\frac{1}{2}$ " Strips forming the rotating frame are fastened to a Bush Wheel that in turn is attached to the Rod 1. The  $3\frac{1}{2}$ " Strips are braced by six  $2\frac{1}{2}$ " Strips. The drive is transmitted from the operating shaft by means of endless cords. Two separate cords are used in order to secure a more positive drive.

### Model No. 3.22 Newton's Disc

This model demonstrates that the colours of the spectrum, which are most simply produced by directing a ray of white light through a prism, can be re-combined to form white light. The cardboard disc is divided into equal sectors, and the seven colours of the spectrum—red, orange, yellow, green, blue, indigo, and violet—are painted on separate sectors. If the disc is rotated at a high speed by means of the hand wheel and the gears shown, the disc appears to be of a greyish-white colour.

The connecting arm is pivoted at its lower end to the Bush Wheel and at its upper end to the hand lever, a bolt and two nuts being used to pivot the arm in each case. The drive is transmitted to a 1" Pulley Wheel on the axle of the road wheels by means of a crossed belt passing round another 1" Pulley that is secured to a Rod connected via a 3:1 gear ratio to the 1½" Rod carrying the Bush Wheel. This Rod is journalled in a 3½" Strip fastened to the side Angle Girder, and also in a Double Bent Strip secured to the inside of the Girder.

## The Meccangaroo

When placed upon an incline the "Meccangaroo" will "walk" with a quaint action. The positions of the various Strips in relation to the body should be reproduced as accurately as possible, for the successful working of the model depends upon them.

The animal rocks about a short Rod secured between the rocker-frame which does duty as "legs." This frame consists of two 3½" Strips 3 bolted at their upper ends to Cranks in which the short Rod is secured, and at their lower ends to two 2½" large radius Curved Strips 4, which are connected together at their ends by 1½" Strips 5 and braced to the Strips 3 by 2½" Strips.

**Model No. 3.29 Pit Head Gear**

The cage is raised and lowered by the cord 1 which is wound between two 3" Pulleys on the  $4\frac{1}{2}$ " Axle Rod 2. The Rod also carries a further 3" Pulley which is provided with a Threaded Pin to form the operating handle, while a  $5\frac{1}{2}$ " Strip 3 secured by an Angle Bracket to the  $5\frac{1}{2}$ " x  $2\frac{1}{2}$ " Flanged Plate bears against the periphery of the Pulley and so serves as a brake. The Strip must be depressed slightly with the fingers whilst winding.

A Bush Wheel 4 on the Rod 2 carries a Threaded Pin that serves as the crank pin of a dummy engine, which is formed by a Sleeve Piece 5 fitted at each end with a  $\frac{1}{2}$ " Flanged Wheel. The Sleeve Piece is mounted on a Pivot Bolt that is passed through its centre hole and lock-nutted to the Plate, being spaced from the latter by a Collar. A 2" Rod passes through the boss of one of the Flanged Wheels and carries at one end a Swivel Bearing, the "spider" of which is mounted loosely on the Threaded Pin. The Bolts securing the Fork Piece to the "spider" should be provided with Nuts to prevent their shanks gripping the Pin. A Crank Handle representing the exhaust steam pipe is secured by Bolts passed through the Boiler, and inserted in the tapped holes of a Coupling and a Collar.

Knife Grinder

The body is a  $2\frac{1}{2}$ " Strip, which is bolted at its lower end to a  $1\frac{1}{2} \times \frac{1}{2}$ " Double Angle Strip 1 and is held upright by a  $\frac{1}{2}$ " Reversed Angle Bracket 2 secured to the Double Angle Strip. Both the latter parts are free to turn about a  $3\frac{1}{2}$ " Axle Rod, and the Double Angle Strip is connected pivotally with the treadle 3 by means of a  $2\frac{1}{2}$ " Strip. The treadle, in turn, is connected pivotally with the crankshaft by two further  $2\frac{1}{2}$ " Strips, each of the Bolts 7 being secured by two Nuts as in Standard Mechanism No. 262.

The Collar 4 is mounted loosely on a  $\frac{1}{2}$ " Bolt secured rigidly to the Crank 5, and forms a handle by means of which the model may be set in motion. The grinding wheel 6 is driven from the 3" Pulley Wheel by an endless belt.

The pivotal arm 1 consists of a 5" Rod, to the ends of which are secured a small and a large Fork Piece, the latter being pivoted to the Double Bracket 2 by means of a  $\frac{3}{8}$ " Rod 4. The hoisting cord controlling the Hook 3 passes under a  $3\frac{1}{2}$ " Rod 4 and is wound on a Crank Handle 5. The cord 6, which raises the jib, is operated by a second Crank Handle 7. It passes over the 1" loose Pulley Wheel 8, round the 1" loose Pulley 9 (which is mounted on a Pivot Bolt) and is then led back again and tied to a Flat Bracket on the 1 $\frac{1}{2}$ " Rod that carries the Pulley 8. Each Crank Handle 5, 7 is provided with a permanent band-and-pulley brake to prevent the jib or the load on the Hook 3 from falling when the handles are released. The method of rotating the crane about its pivot is as follows : The hand wheel consisting of a Bush Wheel fitted with a Threaded Pin is fastened to a  $3\frac{1}{2}$ " Rod journaled in two 1"  $\times$  1" Angle Brackets which are bolted to the  $2\frac{1}{2} \times 3\frac{1}{2}$ " Flanged Plate. This Rod carries a Worm Wheel that meshes with a 57-teeth Gear Wheel fastened to a 2" Rod. The support for this Rod is formed by a Double Bent Strip. Connection between this Rod and the body of the crane is made by means of a 1" Pulley Wheel, a 3" Pulley Wheel fastened to the base of the crane, and a crossed belt joining these two wheels. On rotation of the hand wheel the jib of the crane is, therefore, slowly rotated. The 3" Pulley to which the swivelling portion of the crane is attached, slides on the rim of a second 3" Pulley secured to the base of the model by means of  $\frac{1}{2}$ " Bolts. These Bolts have Washers on their shanks to prevent damage to the rim of the Pulley.

The moving portion of the escape slides on the 12 1/2" Angle Girders 4 of the fixed ladder and is guided by two 1/2" Reversed Angle Brackets 5. The cord for extending the ladder passes over the 1/2" loose Pulley 1 and is wound on the

Crank Handle 2. The Pulley 1 revolves freely on a 1/4" Bolt that is secured by two Nuts to an Angle Bracket bolted to the 3 1/2" Strip.

A 3" Strip, weighted with a 1/4" Flanged Wheel 6 to form a brake lever, is pivoted by a 3/8" Bolt to the 5 1/2" Strip 7, and a piece of cord is passed round the 1" Pulley 3 on the hoisting shaft, and tied to the Strip. The pressure of the weighted lever is sufficient to keep the ladder raised in any position.

### Model No. 3.34 Auto Swing Boat

The connecting Strip 1 is attached pivotally at one end to a Threaded Pin secured to the Bush Wheel 2 on the driving spindle of the motor, and at the other end by means of Bolt and Lock-Nuts to a Crank 3 mounted on the shaft 4, which operates the swing boat.

Four  $5\frac{1}{2}$ " Strips 1 are attached pivotally by lock-nutted Bolts to the  $12\frac{1}{2}$ " Angle Girders, which form the base of the model, and to the carrier 2, which receives the car. The Crank Handle 3 carries a  $\frac{1}{2}$ " Pinion meshing with a 57-teeth Gear on the Rod 4, which forms a drum for a length of cord attached to the carrier. The Rod runs freely in the transverse hole of a Coupling 6 that is secured to the upright Strip by a  $\frac{3}{8}$ " Bolt. A Threaded Pin carries the 1" Pulley 7 and its shank is inserted in the tapped hole of the Coupling, so that when the Pulley is rotated clockwise the Pin nips the Rod. The carrier 2 is returned to its original position by a length of elastic or Spring Cord 8.

It should be noted that the steering cord is given a complete turn around the two  $\frac{3}{4}$ " Flanged Wheels 1 to prevent slipping. The steering column 2 is journalled in the end of a  $1\frac{1}{2}$ " Strip, the other end of which is bolted to a  $2\frac{1}{2}$ "  $\times$   $\frac{1}{2}$ " Double Angle Strip secured between the two Sector Plates 3. The front road wheels are secured to a 5" Rod that is journalled in the end holes of a  $3\frac{1}{4}$ "  $\times$   $\frac{1}{2}$ " Double Angle Strip. The ends of the steering cord are tied to this Strip, which is pivoted by means of a Bolt and Lock-nuts (S.M. 263) to the central hole of a  $1\frac{1}{2}$ "  $\times$   $\frac{1}{2}$ " Double Angle Strip. The latter is bolted between a pair of Trunnions attached to the underside of the  $5\frac{1}{2}$ "  $\times$   $2\frac{1}{2}$ " Flanged Plate. The tank 4 merely rests on the  $5\frac{1}{2}$ " Strips 5.

## Model No. 3.44 Flex Making Machine

The two wires to be twisted are fixed at one end of the machine to a Hook 1 which is attached by an End Bearing to the Crank Handle. At the other end the wires are looped over two Threaded Pins fixed by Collars to the spring controlled Rods 2. The  $3\frac{1}{2} \times 2\frac{1}{2}$  Flanged Plate 3 carrying a  $3\frac{1}{2}$  Rod is free to slide in the built-up channel girders, and as the Crank Handle is turned it is pushed ahead of the twisting wires, so keeping the finished flex even. As the wires shorten through twisting, the Rods 2 slide longitudinally, extending the Spring.

The only feature of this model which needs description is the standard, which is built up of two Angle Girders 1 bolted to the base 2 by Angle Brackets and spaced apart at the top by a  $2\frac{1}{2}$ " Strip obliquely disposed. The balance lever 3 is pivotally carried in Curved Strips 4 bolted to the top of two Angle Girders 5 sliding between the Girders 1. The Girders 5 are themselves bolted together and in order to guide them as they slide vertically two Flat Trunnions 6 and two  $1\frac{1}{2}$ " Strips are bolted at the front and rear. The balance is raised by depressing the lever 7 pivoted at 8 and pivotally connected at 11 to the vertically sliding Girders 5. The indicator 10 is bolted to a Crank at the rear, the boss of which is fitted on the pivot Rod 11. The connections at 12 are lock-nutted to allow free action.

### Model No. 3.48 Fire Truck

The front axle is journaled in a  $2\frac{1}{2}$ " Double Angle Strip that is pivoted through its centre hole to a Double Bent Strip secured to the Flanged Plate 15. Steering is effected from the Pulley 13 secured on a  $3\frac{1}{2}$ " Rod that is passed through the  $3\frac{1}{2}$ " x  $2\frac{1}{2}$ " Flanged Plate 16, and held in position by Collars. On the lower end of the Rod is a Bush Wheel 14, which is connected to the pivoted Double Angle Strip by cords tied to opposite holes in the Bush Wheel and to the ends of the Double Angle Strip.

The lower part of the escape is mounted pivotally on Bolts 10 passed through the upturned ends of a  $2\frac{1}{2}$ " x 1" Double Angle Strip that is bolted to a  $3\frac{1}{2}$ " x  $\frac{1}{2}$ " Double Angle Strip which, in turn, is supported on two vertical  $2\frac{1}{2}$ " x  $\frac{1}{2}$ " Double Angle Strips. The upper or moving portion of the escape slides between the  $12\frac{1}{2}$ " Angle Girders 9 and is held freely in position by the Nuts of the Bolts 11.

The ladder is extended from the Crank Handle 2 (Fig. 3.48A) that is journaled in a  $2\frac{1}{2}$ " x  $\frac{1}{2}$ " Double Angle Strip bolted to a  $5\frac{1}{2}$ " Strip that, in turn, is bolted across the flanges of the Sector Plates. A Cord 7 is wound on to the Crank Handle and one of its ends is tied to a  $2\frac{1}{2}$ " Strip that spans the inner end of the  $12\frac{1}{2}$ " Strips forming the sides of the extending ladder. Its other end 7A is then led towards the outer end of the fixed ladder, round a  $\frac{1}{2}$ " loose Pulley held on a Bolt in the centre hole of a  $2\frac{1}{2}$ " Double Angle Strip that spans the outer ends of the  $12\frac{1}{2}$ "

Girders 9, and finally is tied to the same  $2\frac{1}{2}$ " Strip to which the end 7 is already attached. Thus by turning the handle 2 the escape is pulled inward or outward.

The Crank Handle 1 carries a  $\frac{1}{2}$ " Pinion 3 that engages a 57-teeth Gear 4 secured to a Rod 12. A Cord 8 is wound a few turns round the Rod 12 and is then led to the  $2\frac{1}{2}$ " Strip 5 where it is secured. By turning the Crank Handle the Cord is wound in, thus raising the pivoted escape.

On turning the handle in the opposite direction, the escape is lowered by its own weight.

The seat (a  $1\frac{1}{2}$ " Pulley) is secured on a Threaded Pin and attached to a pair of  $2\frac{1}{2}$ " Curved Strips. The latter are secured to two  $5\frac{1}{2}$ " Strips fixed in the bottom row of holes of the motor plates. A  $2\frac{1}{2}$ " Strip is pivoted to the Motor reversing lever by means of a reversed Angle Bracket, and is supported by a  $1\frac{1}{2}$ " Strip which is attached pivotally to the Motor.

## Model No. 3.50 Pile Driver

On moving the hand lever 6 to the right a  $\frac{1}{2}$ " Pinion on the hoisting shaft is brought into engagement with the 57-teeth Gear Wheel 1 on the driving shaft and the ram 4 is raised. The hoisting cord 2 is tied to an Angle Bracket 3, which lodges under another Angle Bracket bolted to the ram. The latter may be dropped whenever required by jerking the cord 5, thereby releasing the Brackets 3. The Strips 7 are duplicated, and the Girders 8 slide between their ends.

Two pairs of  $5\frac{1}{2}$ " Strips are connected loosely towards their centres by means of Nuts and Bolts 1. The punch 2 consists of a  $1\frac{1}{2}$ " Rod secured in the boss of a Crank 3, which is bolted to a Double Bracket secured at 4. A Spring 5 serves to open the handles after the punch has been used; it is placed on the Rod 2 and held in position by means of a Collar 6, while its other end is attached to a  $\frac{3}{8}$ " Bolt 7 passed through one pair of  $5\frac{1}{2}$ " Strips. After passing through the paper the punch enters the end hole of a 3" Strip 8. The latter is bolted at 9 to a Double Bracket, while its other end passes beneath a similar bracket at 10.

## Model No. 3.53 Paddle Steamer

FIG. 3.53A

The 3" Pulley Wheels forming the paddles are attached to  $3\frac{1}{2}$ " Rods, to the inner ends of which 2" Pulleys are fixed (Fig. 3.53A), and the 2" Pulleys are connected together rigidly by a  $\frac{3}{4}$ " Bolt 1 that is locked in position by nuts. The Bolt 1 forms also a pivot for two small Fork Pieces (one of which is taken from a Swivel Bearing) to which the piston rods of the oscillating cylinders are fixed. The cylinders pivot about  $4\frac{1}{2}$ " Rods, one cylinder being mounted on a  $3\frac{1}{2}$ "  $\times$   $\frac{1}{2}$ " Double Angle Strip while the other is attached rigidly to a Collar 4 by a Bolt on which are placed two Washers. The Collar is secured, of course, to the Rod.

The funnel is built up of eight  $2\frac{1}{2}$ " Strips and eight  $2\frac{1}{2}$ "  $\times$   $\frac{1}{2}$ " Double Angle Strips, which are attached at the top to a  $1\frac{1}{2}$ " Pulley and at the bottom to a Bush Wheel. It is attached to the hull by the lower hole of the Double Bracket 2, Fig. 3.53B. The top hole of this Double Bracket forms a support for the lower end of the escape pipe.

The bridge consists of a  $2\frac{1}{2}$ "  $\times$  1" Double Angle Strip and two  $2\frac{1}{2}$ "  $\times$   $\frac{1}{2}$ " Double Angle Strips, and the complete assembly is bolted to a Double Bent Strip. The latter is attached to a transverse  $2\frac{1}{2}$ " Strip. The Bolt holding the bridge to the  $2\frac{1}{2}$ " Strip serves also to retain a Crank in which the foot of the mast is secured.

The steering wheel 5 consists of a 1" fast Pulley mounted by its set-screw hole on the end of a  $\frac{3}{4}$ " Bolt that is secured to the floor of the bridge. The binnacle is merely a Threaded Pin on which is fixed a Collar.

Most Meccano boys probably are aware of the principles of the Kinetograph, but for the benefit of those who have not seen one in action, we may mention that it is a device which imparts an appearance of animation to a series of pictures, each differing slightly from the other and passed in rapid succession before the eyes. In this respect it resembles the remarkable principle upon which the modern cinematograph is based.

In constructing the Meccano model the following details will prove useful:—The drum consists of a  $12\frac{1}{2}$ " Strip bent to form a circle, with its ends overlapping one hole, and bolted to eight vertical  $5\frac{1}{2}$ " Strips forming the sides. Two pairs of opposite  $5\frac{1}{2}$ " Strips are connected by  $3\frac{1}{2}$ " Strips and Angle Brackets bolted in the third holes from their lower ends. The  $3\frac{1}{2}$ " Strips cross at right angles to one another and are bolted in the centre to a Bush Wheel, in the boss of which is secured a short Rod forming the pivot of the revolving drum. This Rod is journaled in a Double Bent Strip bolted to a  $2\frac{1}{2}$ "  $\times$   $1$ " Double Angle Strip 2. This, in turn, is secured to the base of the model by two  $1$ "  $\times$   $1$ " Angle Brackets 3. A further bearing for the short Rod consists of a Crank bolted to the base of the model.

The drum is rotated from the Crank Handle 4, on which is mounted a  $\frac{1}{2}$ " Pinion engaging a 57-teeth Gear Wheel 5 secured to a  $3\frac{1}{2}$ " Rod carrying a Pulley Wheel 6. The latter is connected by means of a cord 7 to a similar wheel nipped to the vertical spindle of the drum. Bearings are provided for the inner ends of the Crank Handle and  $3\frac{1}{2}$ " Rod by a Double Angle Strip bolted between the Plate 8 and  $5\frac{1}{2}$ " Strip 9. The sighting box 10 is built up from a framework of Strips and is secured by means of a Crank 11 to a short vertical Rod rigidly mounted in the boss of the  $1\frac{1}{2}$ " Pulley 12. The four sides of the framework 10 are covered with some black material; stiff black paper suitable for this purpose may be obtained from any stationers. The drum is enclosed in the same way, but the covering paper should be cut in a strip measuring  $12\frac{1}{2}$ "  $\times$   $4\frac{1}{2}$ " and pierced with slots spaced  $1\frac{1}{2}$ " apart (from centre to centre) so that they fall exactly between the upright  $5\frac{1}{2}$ " Strips. The slots should measure  $1\frac{1}{2}$ "  $\times$   $\frac{1}{4}$ ".

The type of drawing suitable for use in this model is shown in Fig. 3.54A, and the dimensions indicated therein should be followed carefully. No doubt Meccano boys will be able to devise numerous amusing pictures of a similar kind for themselves. The strip of stout white paper carrying the sketches is inserted in the bottom of the drum, as indicated at 13. The model is now ready for operation. Placing the frame 10 over the eyes, the line of vision is directed through the narrow end, where the Strips are held apart by means of Double Brackets, and through the slots in the drum. The latter should be rotated rapidly by operating the handle 4, and as it revolves, the little dog shown in Fig. 3.54A will be seen jumping over the fence with a most realistic and amusing action.

Model No. 3.56  
Horizontal Engine

This model forms an interesting example of the use of the Meccano Boiler, Sleeve Piece and other new parts. The  $2\frac{1}{2}$ " Strip 1, forming the connecting rod, is attached to the  $1\frac{1}{2}$ " Pulley Wheel by means of a Threaded Pin. The latter is fastened in one hole of the  $1\frac{1}{2}$ " Pulley Wheel, and two Washers are placed upon it between the Strip 1 and the wheel. The connecting rod is held in place by a Collar locked to the end of the Threaded Pin. The Boiler is attached to the framework by means of two  $2\frac{1}{2}$ "  $\times$   $\frac{1}{2}$ " Double Angle Strips attached by their centre holes to the side of the Boiler opposite the chimney. When the Boiler is placed in the position shown, the whole is secured by bolting the Double Angle Strips to the side Flanged Plates.

## Model No. 3.57 Tower Wagon

When operated the handle 1 winds in the cord 2, which passes over a  $1\frac{1}{2}$ " fast Pulley Wheel 3 and is tied to the Rod 4. The upper part of the tower is thus raised or lowered as required, being guided by the  $\frac{3}{4}$ " Flanged Wheels 5 and two pairs of Reversed Angle Brackets 6. The steering cords 7 are tied to the 57-teeth Gear Wheel 8 and to the end of a  $2\frac{1}{2}$ "  $\times$   $\frac{1}{2}$ " Double Angle Strip bolted to a Double Bent Strip, which is pivoted to the Sector Plate 9. The front axle is journaled through the ends of the Double Angle Strip.

Electric Motor  
(not included in Outfit)

The steering column 1 is journalled in bearings consisting of a  $5\frac{1}{2}$ " Strip 2 and two  $2\frac{1}{2}$ " Strips 3 (Fig. 3.58A), and carries the Bush Wheel 4, which is secured rigidly to it. A  $\frac{3}{4}$ " Flanged Wheel 5 supports the weight of the steering column 1. The stub axles of the front road wheels consist of  $\frac{3}{4}$ " Bolts, on which the road wheels are spaced by Washers 14. These Bolts serve in the place of set screws to secure two collars to the 1" Rods 8. A pair of Cranks 9, 9a secured to the Rods 8 are joined by two  $5\frac{1}{2}$ " Strips 15 overlapped eight holes. A  $1\frac{1}{2}$ " Strip 10, bolted to the face of the Bush Wheel 4, is connected pivotally by a composite  $4\frac{1}{2}$ " Strip 11 (a  $3\frac{1}{2}$ " Strip and a  $2\frac{1}{2}$ " Strip overlapped three holes) to the end of the Crank 9. When the steering wheel is turned, the Strip 11 moves the Cranks 9 9a, thereby deflecting the front road wheels.

The electric motor 6 is controlled by raising and depressing the handle 7. Duplicate drive transmission belts 12 and 13 are used in order to secure a more dependable drive to the rear axle.

## Keep Adding to Your Outfit

The more Meccano parts you have, the bigger and better the models you are able to build. Keen and enthusiastic model-builders keep adding to their Outfits, until they are able to build all the wonderful models shown in the Meccano Manuals.

The model-building possibilities of the Meccano System are limitless. All the fine models illustrated on this page and page 116 are examples of the types you will be able to build as your Outfit develops.

You can purchase separate Meccano parts as you require them, or, if you prefer, you can purchase Accessory Outfits that connect all the main Outfits.
