

## SPECIAL NOTE TO LEAFLET No. 4

**BLOCKSETTING CRANE**

Since the publication of this leaflet the manufacture of the High Voltage Motor has been discontinued. In its place has been substituted a 6-volt Motor, the current for which may be obtained from a Meccano 6-volt 20 amp. hour Accumulator. A carrier must be provided for the Accumulator in place of the framework 110-111 (Fig. 1). The base of the carrier may consist of four  $4\frac{1}{2}$  in. Angle Girders, joined together to form a square. A vertically disposed  $7\frac{1}{2}$  in. Angle Girder is secured to each corner, and the upper ends of these Girders are bolted to the underside of the boom. The position of the carrier should be varied until the weight of the Accumulator balances the jib.
